

Code of Conduct - Team 62

- Assignment description: In your own words, describe what you need to do as a team in this course.
 - We need to work together to create an application in Java with a backend server using Spring and a frontend GUI using JavaFX. We should use Git and Gitlab for version control to effectively collaborate with each other and hold meetings to discuss ideas. We also need to give each other feedback. A shippable product needs to be completed by the end of the quarter.
- Target or ambition level: What grade are you working for?
 - The target grade for our project is 9. We will achieve this by having each team member complete at least 1 merge request (which includes at least 100 lines of Java code) and code feedback in Gitlab per week.
- Planning: How do you deal with different working hours and working strategies? How do you ensure that each team member finishes their work on time? Who will have a final say in the final deliverable and submits it to Brightspace on behalf of the project team?
 - We need to agree on weekly features during the in person meeting on Friday and make sure everybody does their part by the end of the next week (Saturday 23:59).
 - We should use GitLab to divide all of the user stories into smaller issues (creating small commits). These issues need good descriptions. Also, we should add time estimates and milestones.
 - The entire team will have to agree on the final version of the project (by consensus) and Alexandru Chitoiu-Marin will be responsible for submitting it at least 24 hours before the deadline.
 - In case any errors are committed while committing in Git (pun unintended), squashing commits is preferable for readability.
 - For every task description, we should be specific on what should be done and give it a deadline.
- Communication: In what ways do you communicate with each other as a team and among yourselves?
 - We will use Discord
 - And when we send a message that is sort of an announcement (like “I uploaded this to Gitlab, please prepare x for the next meeting”), the others should react/reply within 24 hours to acknowledge they received it and will do what was told.
 - In general, we’ll participate regularly in the discord chat, daily if possible.
- Collaboration outside of the mandatory meetings: How do you want to collaborate outside the mandatory meetings? How do you communicate? Do you want to have additional meetings?

- We will meet every Friday at 1:45pm, until 5:30pm (the end of our meeting with the TA).
 - This meeting will be to confirm that everybody is on track to finish their work by the end of the week AND to allocate tasks for the next week.
- We will complement these meetings with more sporadic discord calls when necessary OR in-person meetings if we feel like there is still something important that needs to be addressed.
- Helping each other: If someone struggles to finish a task, how can they get help?
 - If a team member struggles to finish a task, they must make an announcement by Friday and will receive help during the weekend. Team members who are on track with their workload will help that person by meeting them online, searching for relevant documentation or contacting the TA for additional aid.
- Work quality: How do you determine the quality of the work that each individual team member contributes?
 - Each team member should do at least one code feedback per week where they review the code of another team member (by rotation) and decide if it is good enough to be merged to the main branch.
 - The branch being merged must:
 - Contain no bugs
 - Follow the checkstyle guidelines
 - Follow the Spring and JavaFX conventions e.g. dependency injection.
 - Have well integrated unit tests (If applicable)
 - Not break the project
- Decision-making: How do you make decisions? By majority vote or by consensus?
 - If a decision needs to be made, it should be addressed during the mandatory meeting on Friday. If a decision has not been made during the mandatory lab, it should be resolved on Discord or in person by the end of the week at the latest. We should reach a reasonable decision by laying out all the pros and cons. We should aim for a consensus. If a decision cannot be made this way, a vote is cast and the majority wins.
- Broken agreements: What do you do if someone in the team does not abide by the agreements reached by the team?
 - Discuss again, and reach a consensus to benefit the whole team (every problem has a solution). If a broken agreement is not solved within 1 week, we will ask our TA for an external opinion or escalate further if the problem remains unsolved.
- Problem resolution: How do you handle disagreements? What do you do if someone is late during a team meeting? When do you escalate to external parties or use them as mediators?
 - Make a summary of the meeting and inform the person about the things that were discussed if the minutes are not clear enough.

- If this behaviour occurs frequently or if an individual does not complete their weekly workload for 2 weeks in a row, we escalate to external parties.
- LLMs for writing code:
 - Yes, but the person who uses an LLM is responsible for fully understanding, testing, and fixing that code.
 - Refine LLM's answers to fit the Checkstyle norms as much as possible.
 - Add documentation to any class or block of code that was created using an LLM with a comment.
